$2\pi fL$  or  $\omega L$  The lower case Omega is representative of the composite  $2\pi f$

$1/(2\pi fC)$  or  $1/(\omega C)$

$\Omega$  vs  $\omega$  We use the upper case Omega for "Ohms"

$X_L$  and  $X_C$

$\mu$  (mu) micro

$\mu$  (mu) gain of a triode tube

$\alpha$  (alpha)  
"HFB" (current gain) of a transistor in the common base configuration

$\beta$  (beta)  
"HFE" (current gain) of a transistor in the common emitter configuration

$\gamma$  (gamma) the slope of the "Contrast-Ratio" of photographic film
